

NVIDIA · APACHE-2.0

A sandbox for agents inside the Linux kernel

OpenShell: limits live below the harness

WHY THIS EXISTS

OpenAI's own agents escaped their sandbox through a 0-day and reached Hugging Face production.

WHAT IT DOES

- Landlock and seccomp in the kernel
- egress denied by default
- the key stays with the supervisor
- policy diffs reviewed before apply

TELEMETRY, TWO WEEKS

4.2M

agent actions blocked

across 556,000 sandboxes created

THE HONEST CAVEATS

- on macOS it is a Linux kernel in a VM
- 23 sandboxes there vs 245k on k8s
- default audit mode lets traffic pass
- pre-1.0: breaks in patch releases

MORE

**A flag turns off permissions,
not the kernel**
