Agent memory as a file system

OpenViking by ByteDance

THE PROBLEM

- Agent memory is a vector dump
- Embeddings return something similar
- You cannot debug why it matched
- Tokens burn on noise

HOW IT WORKS

- Memory, docs and skills in one FS
- The agent walks it: ls / tree / find
- A ~100-token abstract per file
- Full text only on demand

LOCOMO

57 - 80%

Claude Code with this memory

INPUT TOKENS DOWN 34-91%

CAVEATS

- Benchmarks are self-reported
- Measured on their own Doubao models
- AGPL-3.0 blocks quiet SaaS use
- Version 0.4, APIs still break

TAKE A LOOK

**Memory you can open
and read with your eyes**
