Cordis

plugins that know how to unload

THE PAIN

import is one-way: once a module runs and sets timers, only a restart removes it

every TS project

HOW IT WORKS

- Services live in a context
- `ctx.effect()` must return a disposer
- `inject` waits for its dependency
- Provider reloads, consumers follow

SCALE

1848

lines of core

4 years behind Koishi, 4524 plugins

THE CATCH

API is unstable, version
is 4.0.0-rc.8, and the docs
moved to DeepSeek

README, August 17
