Agent memory that moves between CLIs

ai-memory — context across coding
agents

THE PAIN

You close Claude Code,
open Codex, and it
knows nothing

four hours of context, gone

WHAT IT IS

- A single Rust binary on agent hooks
- Sessions compiled into a markdown wiki
- The wiki lives in git, fully reviewable
- SQLite FTS5 search, no vector database

THE HANDOFF

- Where-you-left-off note for the next CLI
- Printed before your first prompt
- 20+ harnesses: Codex, Cursor, Gemini
- Managed mode: ai-memory run claude

COST OF MEMORY

\$0.05

to bootstrap a repo, \$0.02 per consolidation

ZERO-LLM MODE COSTS NOTHING

TRY IT

**Memory belongs to the
project, not the vendor**
