XTOOL · 13.4K STARS · MIT

An iOS app built on Ubuntu

The build half of Xcode moved to any machine you own

WHAT A MAC COSTS IN CI

10–17x

pricier than Linux

$0.062–0.102 vs $0.006 per minute on GitHub Actions

WHAT XTOOL DEV DOES

- builds a SwiftPM package into an .ipa
- signs it: a zsign fork, not codesign
- installs on a real iPhone and launches
- project is Package.swift plus xtool.yml

WHAT IS MISSING

- Interface Builder and asset catalogs
- no simulator: a physical device is needed
- no LLDB out of the box, no App Extensions
- no App Store submission

THE HONEST TRADE-OFF

You still download
Xcode.xip
exactly once

the SDK is extracted from your own copy, license intact

TAKEAWAY

The Mac is now just a license signature
