

SCRIPTC · VERCEL LABS

TypeScript into a native binary

No V8, no JIT, no Node runtime inside

THE PROBLEM IT SOLVES

- a 50-line CLI tool drags 120 MB of Node
- every single run costs about 100 ms
- an agent calls it hundreds of times
- those 100 ms turn into minutes

MEASURED ON HELLO.TS

71 KB

binary, 3.9 ms startup

node file.ts takes 100 ms and 67 MB RSS

HOW IT WORKS

- type-checked by the real TS compiler
- lowered into C and LLVM IR
- links a tiny native runtime written in C
- `bun --compile` ships 57 MB for comparison

THE HONEST TRADE-OFF

Any npm package drops your code
into an embedded QuickJS.
So does `String.replace`.

WHAT TO DO WITH IT

- scriptc coverage prints your static share
- single-file fs and fetch tools hit 100%
- Rauch compiled the vercel CLI to 1.28 MB
- Apache-2.0, 5.8k stars, still experimental
