

OPENRIG

Claude Code and Codex as one team

Your agent fleet described in YAML, each
one alive in tmux

THE PROBLEM IT SOLVES

- your terminal holds six agent sessions, not one
- after a reboot you forget which was which
- it takes half an hour to reconstruct
- nothing can snapshot the whole setup

HOW IT WORKS

- a local daemon over SQLite and tmux
- every agent is a seat in a YAML topology
- plan and review on Codex, build on Claude
- you can attach and type into any seat

SCALE

1.9k 

in two days of trending

Apache-2.0, TypeScript, still pre-1.0

WHAT YOU ACTUALLY GET

- rig down --snapshot, then rig up again
- the whole topology comes back named
- rig discover adopts sessions you already run
- agents reshape the rig through MCP

THE HONEST TRADE-OFF

It edits your home configs
and turns on `acceptEdits`.
