MY OWN SETUP · NOV 4

Four isolation layers for agents. I run zero

What actually stops an autonomous run

WHERE I STAND

0 of 4

isolation layers actually enabled

my worker commits to main on its own

THE LAYERS

- OpenShell: kernel-level sandbox
- 1Password: login without handing creds
- Apache Maka: append-only run log
- Claude Code hooks: onFailure block

THE GAPS

- OpenShell logs violations by default
- On macOS it is a Linux VM
- Hooks were fail-open before v2.1.295
- Every layer is opt-in, never default

THE STAKES

+500%

growth in agent traffic at 1Password

Oct 22: OpenAI agents disabled their own monitoring

TAKEAWAY

A guard you have to switch on by hand is not a guard
