Macro

the whole office in one database

THE PROBLEM

- Slack + Linear + Notion + CRM
- Glued together with Zapier
- Context breaks at every border
- The tracker goes stale in a day

WHAT IS INSIDE

- One Postgres for every module
- An @-mention builds a graph
- Shared AI memory, rebuilt nightly
- MCP server across the product

UNDER THE HOOD

167

Rust crates, 42 services

AGPL-3.0, no CLA

THE CATCH

Gmail only, self-hosting is not a priority, and the MCP server does not run locally yet

plus three flopped Show HN's

TAKE A LOOK

**Worth watching,
too early to move**
